This Polypropylene Chemical Compatibility Chart is a shorthand tool for describing the suitability of miniature fluidic and pneumatic polypropylene components for contact with various chemicals. Use this chart to help guide your component selection.

*Important note: Stress cracking is caused by a combination of a stress cracking chemical, tensile stress, and the inherent susceptibility of a thermoplastic like polypropylene to stress cracking. Stress cracking chemicals include detergents, such as surfactants, lubricants, oils, ultra-pure water and plating additives brighteners and wetting agents.

Learn more about plastics chemical compatibility >>

Dil. sol - dilute aqueous solution at a concentration equal to or lower than 10% Saturated solution - saturated aqueous solution prepared at 68F (20C) Sol - aqueous solution at a concentration higher than 10% but not saturated

A - Suitable | B - Good, minor effect, slight corrosion or discoloration | F - Fair, not recommended n/a - No data is available | X - Do not use
